RXTE Project Scientist

Reasons to Continue RXTE

- RXTE's **large area sub-millisecond timing** capability remains unique.
- RXTE's **observing flexibility** remains unduplicated.
- RXTE's **broad spectral band** is valuable as a constraint on narrow band, high resolution spectra.
- RXTE continues to be **productive at low cost**; 3 invited and >33 contributed papers at recent AAS/HEAD meeting; major contributions at COSPAR 2008.
- RXTE observations are highly sought after to **support many multi-wavelength and multi-mission observing programs**.
- **Anticipated multi-mission opportunities** during the 2009-2011 period represent new science (combining timing and spectra, and unprecedented energy coverage).
- New Core Science Program will **provide important additional public access** to data.

Recent Science Highlights

Neutron Stars

- Discovery of a 70.5 ms, energetic pulsar associated with a TeV (HESS) source (ATels from 2008 Feb and Mar, ApJ paper in press).
- Discovery of a magnetar/rotation-powered pulsar transition object.
- Discovery of intermittent accreting millisecond pulsars (AMPs, HETE J1900.1-2455, SAX J1748.9-2021, Aql X-1).
- Millisecond pulsar spin down between outbursts and orbital period growth too fast for gravitational radiation alone (SAX J1808.4-3658).

SMBHs

- Tracking the injection of plasma blobs in the BL Lac jet (Nature 2008).

Galactic BHs

- Measurement of inner disk radii in low-hard state (in coordination with Swift and XMM-Newton).
- Spin and mass measurements for black holes in progress, and the lightest known black hole (XTE J1650-500, $3.8 M_{\odot}$).

Mini-black hole is smallest ever found

Maggie Fox, Reuters
Published: Wednesday, April 02, 2008

WASHINGTON - NASA scientists have identified a "strange of spaghetti" with its pull, the research says.

But the mini-black hole, dubbed J1650, could "stretch your body into a strand of spaghetti" if you ventured too close to it, the researchers said.

"This black hole is really pushing the limits. For many years astronomers have wanted to know the smallest possible size of a black hole, and this little guy is a big step toward answering that question," Nikolai Shaposhnikov of NASA's Goddard Space Flight Center in Greenbelt, Md., said in a statement.

It would likely be stronger than bigger black holes found at the centres of galaxies. Shaposhnikov said if someone ventured too close to J1650, its gravity would "stretch your body into a strand of spaghetti."

Like other black holes, it was formed by a star that ran out of fuel and shut down, collapsing due to its own gravity.

Mini-black hole still has puzzle
Reuters | Wednesday, 02 April 2008

Nasa scientists have identified the smallest hole ever found - less than four times the size of our sun and about the size of a large city.

But the mini-black hole, dubbed J1650, could still stretch your body into a strand of spaghetti, the researchers told a meeting in Los Angeles.

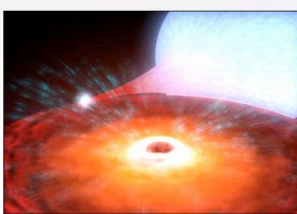

"This black hole is really pushing the limits. For many years astronomers have wanted to know the smallest possible size of a black hole, and this little guy is a big step toward answering that question," Nikolai Shaposhnikov of Nasa's Goddard Space Flight Centre in Greenbelt, Maryland, said in a statement.

It would likely be stronger than bigger black holes found at the centres of galaxies. Shaposhnikov said if someone ventured too close to J1650, its gravity would "stretch your body into a strand of spaghetti".

Like other black holes, it was formed by a star that ran out of fuel and shut down, collapsing due to its own gravity.

Smallest Known Black Hole Discovered

Richard A. Lovett
for National Geographic News
April 2, 2008

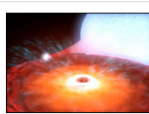

Astronomers have identified the smallest known black hole about 3.8 times as massive as the sun.

The black hole, part of a binary star system known as XTE J1650-500, is about 15 miles (25 kilometers) in diameter, said Nikolai Shaposhnikov, an astrophysicist at NASA's Goddard Space Flight Center in Greenbelt, Md.

Shaposhnikov announced the discovery Monday in Los Angeles at the American Astronomical Society's meeting in San Francisco. He is with the American Astronomical Society's Astrophysics Division.

The black hole is located light-years away in the constellation Cygnus.

Scientists say the object has a mass limit at which stars collapse into black holes. At smaller masses, stars or neutron stars form.

NASA scientists identify smallest known black hole in universe

Q + - 08:13, April 03, 2008

Two astronomers at NASA's Goddard Space Flight Center have identified the smallest known black hole in the universe, according to the Astrophysical Journal on Wednesday.

Iran's daily oil output has reached a record high.

Lightest galactic black hole found

Web, 02 Apr 2008 21:00:58

NASA scientists have discovered the Milky Way's smallest black hole in a binary star system in the galaxy known as XTE J1650-500.

Shaposhnikov and Lev Titarchuk from NASA's Goddard Space Flight Center in Greenbelt, Maryland used a new method to estimate the size of the black hole with NASA's Rossi X-ray Timing Explorer satellite.

The mini-black hole has just a diameter of 15 miles and a mass about 3.8 times greater than the size of the sun, but Shaposhnikov believes it could still "stretch your body into a strand of spaghetti".

The smallest black hole previously identified was GRO 1655-40, with a mass of about 6.3 Suns.

"Amazingly, equations from Albert Einstein predict that a black hole with 3.8 times the mass of our Sun would be only 15 miles across -- the size of a city," a NASA statement said.

Smallest black hole ever 'discovered'

New York (PTI): Astronomers have discovered what they say is the lightest known black hole which has amazing tidal forces.

Using a new method, they have identified the black hole as about 3.8 times greater than Sun and a diameter of only 15 miles.

"This black hole is pushing the limits. For many years astronomers have wanted to know the smallest possible size of a black hole and this little guy is a big step toward answering that question," lead astronomer Nikolai Shaposhnikov of NASA's Goddard Space Flight Centre, Greenbelt, Md., said.

According to the astronomers, smaller black holes like the one they discovered have stronger tidal forces than the larger black holes found in our galaxy. Shaposhnikov said if you ventured too close to J1650-500, its gravity would "stretch your body into a strand of spaghetti", Shaposhnikov said.

The method used by the NASA team to identify the black hole is a new technique, two NASA scientists have identified the lightest known black hole. With a mass only about 3.8 times greater than our Sun and a diameter of only 15 miles, the black hole lies very close to the minimum size predicted for black holes that originate from dying stars.

"This black hole is really pushing the limits. For many years astronomers have wanted to know the smallest possible size of a black hole, and this little guy is a big step toward answering that question," says lead author Nikolai Shaposhnikov of NASA's Goddard Space Flight Center in Greenbelt, Md.

The tiny black hole resides in a Milky Way Galaxy binary system known as XTE J1650-500, named for its sky coordinates in the southern constellation Cygnus.

Fundamental Black Hole Parameters

Measuring BH Mass

XTE J1650-500:
Low-mass black hole

... and this may be the only mass measurement method that works for large numbers of putative intermediate-mass BHs

Uses RXTE's unique combination of spectral and timing capabilities

Measuring BH Spin

Improved Reflection Models

New (2008 Apr.) RXTE+XMM result:
GX 339-4 BH spin measured to be 0.92 ± 0.04 (Reis, Fabian et al. 2008, subm.)

Fitting the Continuum with Relativistic Disk Models

McClintock et al. (2006) find $a_* > 0.98$ for GRS 1915+105

Don't forget about the kHz QPOs

450/300 Hz QPO pairs in GRO J1655-40 indicate $a_* = 0.4-0.9$.

Disk/Jet Coupling in Black Hole Systems

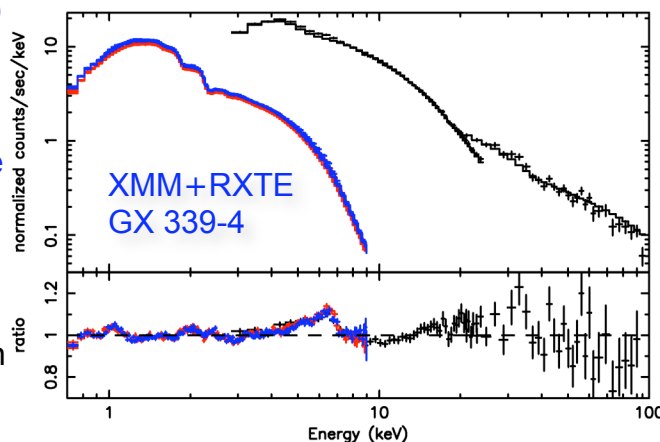

- For Galactic black holes, **only the hard state has a steady jet.**
- **RXTE** is key to the on-going debate concerning the hard state geometry.

Can the base of the jet subsume the role of the corona?
(Markoff, Nowak, & Wilms 2005)

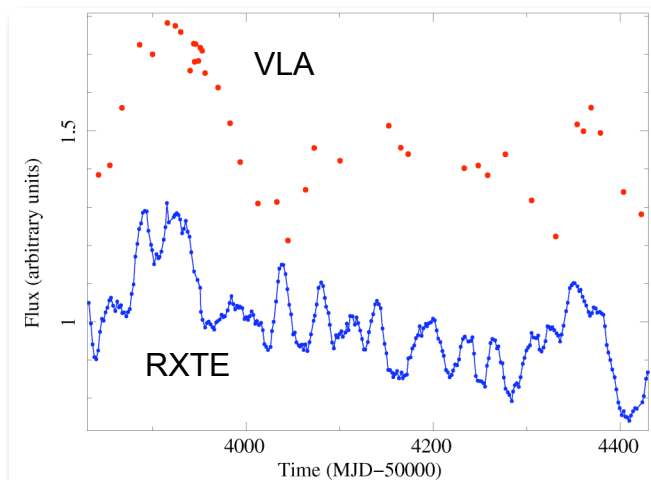

• The Miller et al. (2006) GX 339-4 study marks the first time relativistic models have been applied to the hard state ($R_{in}/R_g = 4.0 \pm 0.5$).

• RXTE (PCA+HEXTE) provides critical bandpass coverage with the highest statistical quality.

Progress is also being made on Seyfert AGN via RXTE, radio, optical monitoring

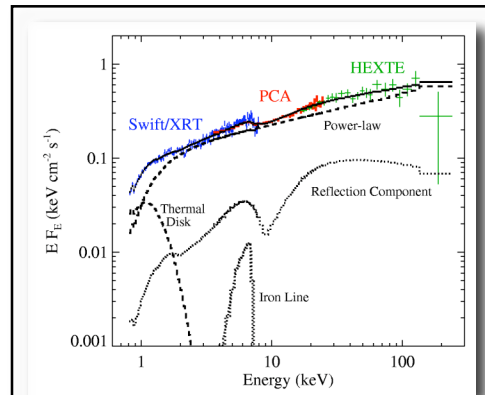

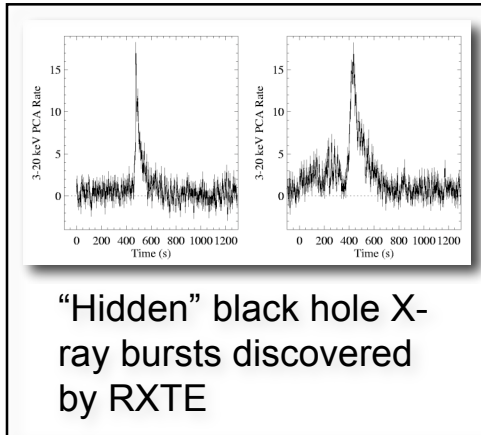

X-ray (RXTE) and radio (VLA) light curves for NGC 7213 correlated with a delay of <20 days (Uttley et al., in prep.)

Using RXTE's broad spectral band

RXTE also important for Blazar studies, especially with the upcoming GLAST launch

RXTE Capabilities for Observations of Galactic Black Holes at Low Luminosities

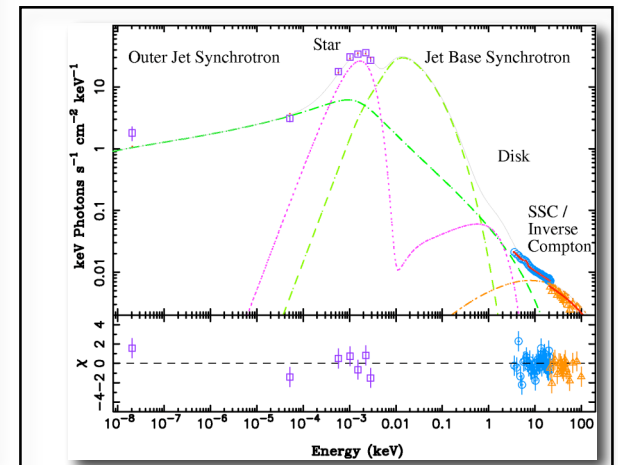

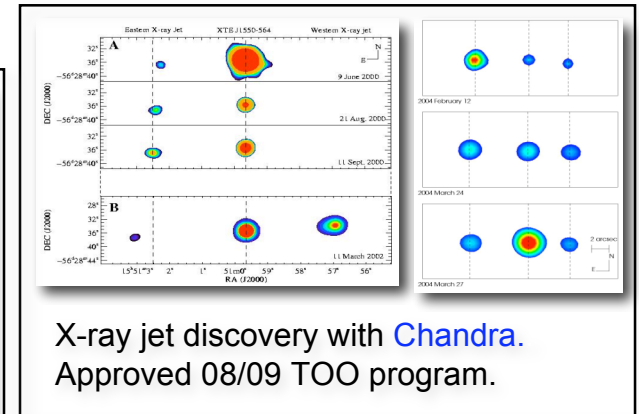

Smearred reflection features (in the hard state) with *Swift*. Approved TOO programs with *Swift*, *XMM-Newton*, and *Suzaku* in 2008/2009.

RXTE ASM and PCA light curves for the low-mass Galactic black hole XTE J1650-500

Using RXTE’s flexibility and providing multi-wavelength and multi-mission support.

RXTE Discovers First Magnetar-like X-ray Emission from a Rotation-powered Pulsar

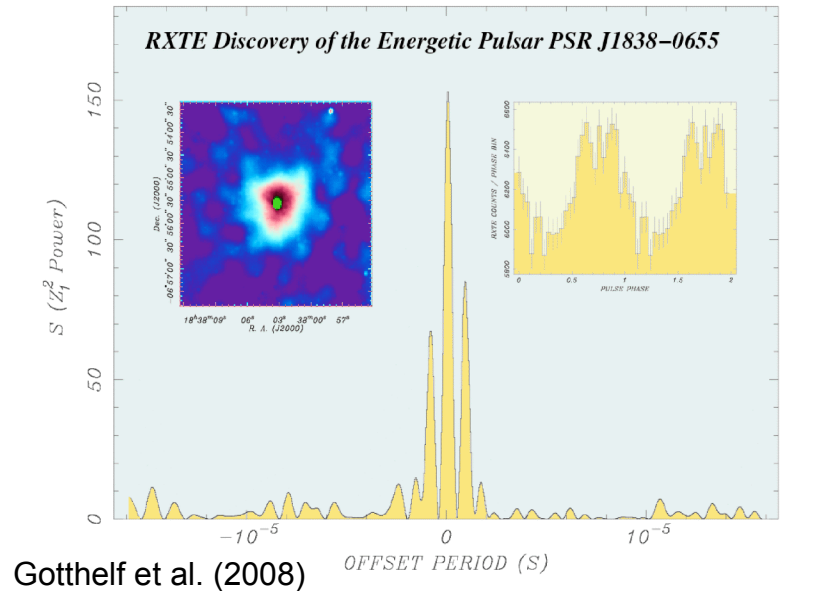

- A key question: at what magnetic field strength does magnetar behavior begin, and why?
- Until recently, no rotation-powered pulsar had ever exhibited magnetar properties (bursts, flares, and dramatic changes in pulse timing).
- Gavriil et al. (2008) found the first magnetar-like bursts, and a pulsed flux flare from a rotation-powered pulsar (PSR J1846-0258 in Kes 75).
- *Chandra* imaging also revealed the flare in total intensity.
- PSR J1846-0258 is the first pulsar - magnetar transition object! Indicates that magnetar behavior can exist over a much wider range of inferred field strengths than previously thought.
- **Future RXTE observations will target a larger sample of high-field pulsars.**

Gavriil et al. (2008)

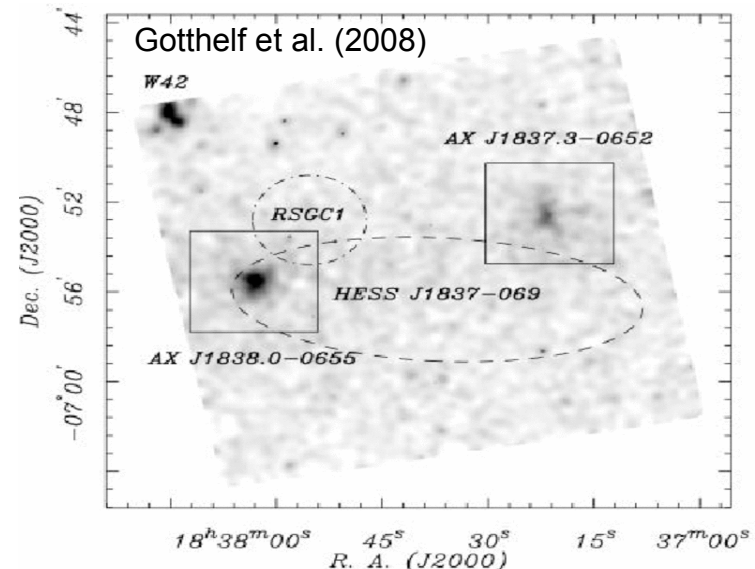

Discovery of Pulsar AX J1838-0655: A Pulsar Wind Nebula -- TeV Association

- RXTE recently discovered 70.5 ms pulsations from AX J1838.0-0655, and also measured the spin-down rate, indicating a young, energetic pulsar (Gotthelf et al. 2008; Kuiper et al 2008).
- **Future RXTE observations will confirm new pulsar - TeV associations, and constrain the energetics of the PWN.**

- HESS observations have discovered several extended TeV sources apparently coincident with pulsar wind nebulae (PWN; Aharonian et al. 2006).
- Some HESS sources are suspected PWN, but pulsar detections are lacking.
- HESS J1837-069 is coincident with AX J1838.0-0655, a PWN recently imaged with CHANDRA.

New Neutron Star Mass Estimates from Relativistic Fe Lines and Kilohertz QPOs

Cackett et al. (2008)

- Recent *XMM-Newton* and *Suzaku* observations have found relativistic Fe lines in several accreting neutron star binaries (Bhattacharyya & Strohmayer 2007; Cackett et al. 2008).
- Both Fe line profiles and kHz QPO frequencies provide inner disk diagnostics.
- Simultaneous QPO and Fe line detections can provide a new way to estimate the stellar mass.
- **Suzaku observations of Cyg X-2, 4U 1820-30, and GX 340+0 approved. RXTE will provide required simultaneous coverage.**

$$v_{\text{orb}} = (1/2\pi) (GM_{\text{ns}}/r^3)^{1/2}$$

$$M_{\text{ns}} = v_{\text{orb}}^3 / (2\pi G v_{\text{orb}})$$

$$v_{\text{orb}} = (GM_{\text{ns}}/r)^{1/2}$$

Marginally Stable Nuclear Burning: A New Probe of Neutron Stars

- RXTE observed mHz QPOs from several accreting LMXBs (eg., 4U 1636-53; Revnivtsev 2001; Altamirano et al. 2008).
- Theory predicts marginally stable burning (quasi-periodic) when the accretion rate is near the critical rate for instability (Heger et al. 2007).
- Approach to instability directly seen for first time with RXTE: mHz QPO drops below 8 mHz, X-ray bursts occur!
- mHz QPO frequency has dependence on surface gravity $\propto M/R^2$ as well as composition. Can probe surface physics and structure.
- **Future goals: observe marginally stable burning in more objects, in particular, helium accretors for which composition is known.**

New Program Elements

- Observations **correlated with GLAST for AGN and Galactic sources:**
 - RXTE Cycle 12 includes 7 programs for multiple targets;
 - GLAST Cycle 1 includes 3 programs requiring RXTE and many for which RXTE would be likely to provide X-ray coverage;
 - RXTE timing of radio-quiet X-ray pulsars will enable GLAST studies;
 - RXTE Cycle 13 is expected to include similar proposals.
- Observations **correlated with upgraded TeV observatories:**
 - Veritas, HESS, MAGIC are pursuing coordination with RXTE.
- **Immediate public accessibility of “core program” observations:**
 - PCA scanning of the Galactic bulge provides triggers and context;
 - follow-up observations of new Galactic sources find their nature;
 - dense observations of new and recurrent AMPs and BH transients have application to many physics questions.
- **Transfer to Multi-mission Operations Center** to reduce costs.

Cost Reductions

Manpower (Full Time Equivalents):

	1997 (Peak)	2004	2008	2009	2010
Mission Ops	16.0	10.00	6.6	5.5	4.5
SOF	12.00	3.50	2.3	2.3	2.3
GOF	16.00	3.45	1.4	1.4	1.4
<u>ITs</u>	<u>33.00</u>	<u>10.88</u>	<u>6.5</u>	<u>6.4</u>	<u>6.1</u>
Total	77	27.8	16.8	15.6	14.3
Total (real yr K\$):	7718⁺	5844	2355[*]	1425[*]	3105

+ 1997 is not full cost, GO not included.

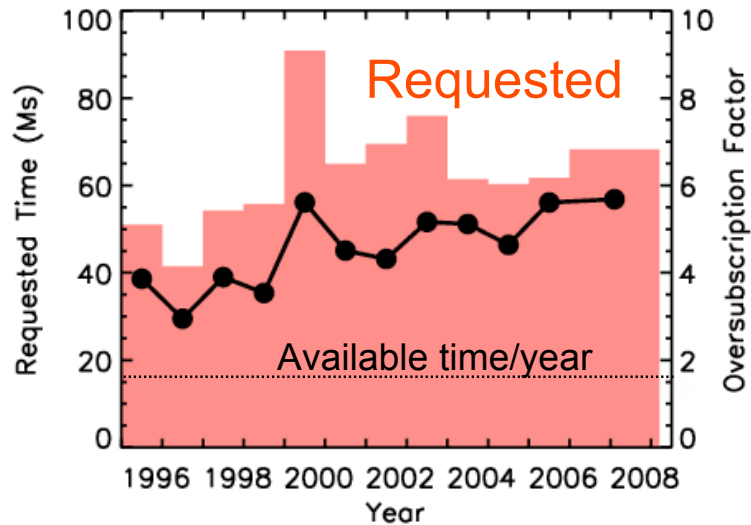

* Carryover allowed operations with low new funding.

Change enabling cost reduction:

•Operations	24x7	12x7(auto)	8x6	8x5	Multi-mission
•Science processing	tapes, by XSDC	internet, by GOF			
•Spacecraft info	FDF, Pacor		by MOC		
•Help desk	full	reduced	bare (PI teams supplement)		

RXTE Remains Popular and Productive

- 153 Cycle 12 proposals.
- 361 unique PIs (AO 1-12).
- 6.8 TB (4 x archive) downloaded in 2007.
- Publication rate (refereed) remains high and steady at ~160 per year.
- Rapid notifications (Atel, IAUC, GCN) fluctuate at about 60 per year.
- Conference reports remain significant at 85 per year.
- High-impact citation rate: ~15 citations/paper (2004-2006, of papers published in 2003; Trimble 2007).
- 7 press releases since April 2006.
- 82 PhD theses.

Hardware Status

-
- Changes have been relatively minor since the 2006 review.
 - The hardware during the next few years should be substantially the same as that used to obtain the recent results.
 - One Proportional Counter Unit (1250 cm²) has shown no faults.
 - One counter reaches background limits in 1000 s for AGN (0.2 mCrab) and for the Galactic bulge scans (1 mCrab).
 - Duty cycles of 20% for each of the other PCUs enables 2-3 PCUs for most galactic timing studies, 4 or 5 occasionally.
 - HEXTE Cluster B (rocking) provides a background model for Cluster A (not rocking).
 - Partial loss of ASM sensitivity is possible, but the PCA scans go deeper for the Galactic bulge, and ASM all-sky coverage would remain.
